First circular - New dimensions for Natural Hazards in Asia: An AOGS-EGU Joint Conference

- This international conference brings together **students, early career** and **established scientists** from all areas of the globe.
- The aim is to discuss **current advances** in knowledge and **new perspectives** relevant to natural hazards in the Asian region.
- We particularly invite those interested in these themes:
 - **Natural hazards in the megacity.** The physical (e.g., early warning, monitoring, scenarios, precursors), and physical-social complexities of natural hazards in megacities.
 - **Transient and long-term effects of catastrophic perturbations.** The long-term effects, impacts and legacy to the environment and human systems after a natural hazard event, particularly health impacts.
 - **Multi-hazard interactions (cascades).** One hazard triggering or increasing the probability of another hazard occurring (documenting case examples, quantifying causal links, hazard cascades, risk and stakeholder awareness of that risk).
 - **Communications** before, during and after a natural disaster (including education, policy-science interface, uncertainty, scenarios).
 - **Hazard development under a changing climate.**
 - **Black swans and grey swan events.** Low recurrence, high magnitude events.
- We invite **contributions in the above themes, from the practical to the theoretical.** Although primarily aimed at geo-scientists and geo-engineers, we also encourage contributions from economists, social scientists, historians, policy actors, educators and hazard practitioners.

Event date: **04 - 08 February 2018**

Event location: **Tagaytay, Philippines**
